# Building a Cultural Context Aware AI

---

## 1. 개요

- 1) Why Cultural Context Matters
- 2) Preliminaries: KD
- 3) Goal of this Project

## 2. 환경 및 데이터셋

## 3. 알고리즘 소개

## 4. 실험 설계

## 5. 결과 분석

## 6. 토의 및 결론

### The Challenges

- LRMs(Large Reasoning Models) often fails to generate correct reasoning path when cultural knowledge is required.
- This happens more frequently in smaller LRMs (1.7B, 4B size).

➔ Input Query: 제사상을 차릴 때 홍동백서는 무엇을 의미하나요?

Qwen3-32B	Qwen3-4B
<p>홍 could be 빨강, meaning red. 동 is 동서의 동, east. 백 is white, and 서 is west. So, 홍 is red, 동 is east, 백 is white, 서 is west. That makes sense with the four cardinal directions.</p> <p>...</p> <p>"홍동백서(紅東白西)"는 조선시대 예절서인 『규례』와 관련된 제사의식에서 사용되는 표현으로, 제사상(祭饌)의 배치 원칙을 설명합니다.</p>	<p>I know that in Korean, "백서" (baekseo) is a term related to a type of paper used in rituals, like a "baekseo" which is a type of white paper used for offerings.</p> <p>...</p> <p>"홍동백서" (홍동백서)는 전통 한국의 제사상(祭壇)을 세우는 과정에서 사용되는 **백서(白書)**의 한 종류로,</p>

## Knowledge Distillation(KD)

- KD trains a student model  $M_s$  to match a teacher model  $M_t$  by minimizing a token-level divergence between their output distributions.

## Off-Policy KD

- Student is trained only on teacher-generated answers or offline labels.
- This is called as Supervised Fine-Tuning(SFT) in some perspective.
- However, this needs lots(a lot!) of datasets and often destroys the student's own reasoning ability

## On-Policy KD

- Student rolls out its own samples, and the teacher is used to match or correct token-level behavior.
- Speculative KD is one of this type.
- Teacher and student usually see the same input  $Q$  only.

Can we inject new cultural knowledge while preserving the student's reasoning path?

- On-Policy KD: 한국 문화 관련지식을 smaller LRM에 주입하는 training framework 제안
- With small amount of dataset, we can train the model but not destroying the original reasoning abilities.

Qwen3-4B (AS-IS)	Qwen3-4B (TO-BE)
<p>I know that in Korean, "백서" (baekseo) is a term related to a type of paper used in rituals, like a "baekseo" which is a type of white paper used for offerings.</p> <p>...</p> <p>"홍동백서" (홍동백서)는 전통 한국의 제사상 (祭壇)을 세우는 과정에서 사용되는 **백서(白書)**의 한 종류로,</p>	<p>홍 could be 빨강, meaning red. 동 is 동서의 동, east. 백 is white, and 서 is west. So, 홍 is red, 동 is east, 백 is white, 서 is west. That makes sense with the four cardinal directions.</p> <p>...</p> <p>"홍동백서(紅東白西)"는 조선시대 예절서인 『규례』와 관련된 제사의식에서 사용되는 표현으로, 제사상(祭饌)의 배치 원칙을 설명합니다.</p>

6. 토의 및 결론

### Training Data

- 200 (Query, Knowledge) pairs
  - 5 categories, 40 samples
- Sources are:
  - Encyclopedia of Korean Culture
  - Wikipedia
- Korean, English(machine translated)
- Knowledge field contains a short paragraph describing a specific Korean cultural concept.

Category (EN)	Count
Tradition	40
History	40
Food	40
Geography	40
Modern Culture	40
<b>Total</b>	<b>200</b>

```
{
  "id": "tradition_002",
  "category": "전통예절",
  "query": "제사상을 차릴 때 홍동백서는 무엇을 의미하나요?",
  "knowledge": "홍동백서(紅東白西)는 제사상 진설법의 기본 원칙 중 하나로, '붉은 과일은 동쪽, 흰 과일은 서쪽'에 놓는다는 규칙입니다. 구체적으로 대추, 홍시, 사과 등 붉은 색 과일은 제사의 동쪽(제주 기준 왼쪽)에 배치하고, 밤, 배, 귤 등 흰색이나 밝은 색 과일은 서쪽(제주 기준 오른쪽)에 놓습니다. 이는 음양오행 사상에서 동쪽은 양(陽), 서쪽은 음(陰)을 상징하며, 붉은색은 양기를, 흰색은 음기를 띤다는 관념에서 유래했습니다. 조율이시(棗栗梨柿, 대추-밤-배-감 순서로 배치)와 함께 가장 기본적인 제사상 진설 원칙으로, 지역에 따라 세부적으로 다를 수 있으나 대부분의 유교 제례에서 따르는 규범입니다. 현대에는 과일의 색과 위치를 엄격히 따르지 않는 경우도 많으나, 전통 예법에서는 중요한 원칙입니다."
}
```

### Training Data

- Knowledge Field Length Distribution

### State

- $q$ : query
- $y_{<t}$ : generated tokens ( $y_0, \dots, y_{t-1}$ )

$$s_t = (q, y_{<t}),$$
$$\mathcal{S} := \{ (q, y_{<t}) \}.$$

### Action

- $\mathcal{V}$ :

$$\mathcal{A} := \mathcal{V},$$
$$a_t \in \mathcal{A} \quad (\text{next token } y_t),$$
$$\pi_\theta(a_t \mid s_t) = p_\theta(y_t = a_t \mid q, y_{<t}).$$

### Reward

- Most

$$y_t^{(s)} \sim \pi_\theta(\cdot \mid s_t),$$
$$A_t = \begin{cases} 1, & \text{if teacher accepts } y_t^{(s)}, \\ 0, & \text{if teacher replaces it with } y_t^{(t)}. \end{cases}$$

1. 개요
2. 환경 및 데이터셋
3. 알고리즘 소개
  - 1) LUPI
  - 2) SKD
4. 실험 설계
5. 결과 분석
6. 토의 및 결론

# 알고리즘 소개

## LUPI

### Learning Using Privileged Information(LUPI)

- Training with privileged triplets:  $(x, x^*, y)$  where  $x^*$  is privileged information that only teacher knows
- Originally used in classification tasks

$$(x_1, x_1^*, y_1), \dots, (x_\ell, x_\ell^*, y_\ell), \quad x_i \in X, \quad x_i^* \in X^*, \quad y_i \in \{-1, +1\},$$

### LUPI triplet

- We adopt this triplet on our dataset, giving teacher query+knowledge but only query on student model
- $M_t, M_s$ : Teacher / Student LM

$$(x, x^*, y) = (Q, K, Y), \quad Y = (R, A)$$

$$M_t(Y \mid Q, K)$$

$$M_s(Y \mid Q)$$

# 알고리즘 소개

## SKD

Speculative Knowledge Distillation (SKD) (On-Policy RL used in KD field)

- For given prompt  $x$  and answer(reference) sequence  $y = (y_1, \dots, y_{L_y})$ , compare two distribution for every decoding step  $i$ .

$$D(M_t || M_s)(y|x) = \frac{1}{L_y} \sum_{i=1}^{L_y} D(M_T(.|y_{<i}, x) || M_s(.|y_{<i}, x))$$

- Training objective – Make student model's distribution to be similar of teacher's one.

$$\min_{\theta_s} D(M_t || M_s)(y | x)$$

### LUPI-aware SKD Rollout

- teacher\_input\_ids are Query+ Knowledge
- student\_input\_ids are only Query

```
def lupi_skd_rollout_adaptive(
    teacher_model: PreTrainedModel,
    student_model: PreTrainedModel,
    teacher_input_ids: Tensor,
    student_input_ids: Tensor,
    max_new_tokens: int,
    top_k: int,
    gamma: int,
    teacher_temperature: float,
    student_temperature: float,
    teacher_top_p: float,
    student_top_p: float,
    teacher_min_prob: float = 0.0,
    tokenizer: Optional[PreTrainedTokenizerBase] = None,
    end_of_string_ls: Optional[List[str]] = None,
    verbose: bool = False,
    print_every_blocks: int = 10,
) -> Tuple[Tensor, Tensor, List[int], str, dict]:
    """Adaptive Gamma LUPI-aware SKD rollout with detailed debugging."""
    # Detect devices independently
    teacher_device = next(teacher_model.parameters()).device
    student_device = next(student_model.parameters()).device
    dtype = teacher_input_ids.dtype

    # Initial placement
    teacher_ids = teacher_input_ids.to(teacher_device).clone()
    student_ids = student_input_ids.to(student_device).clone()
```

## Student draft with Parallel Teacher Verification (SKD loop)

```

while len(generated_tokens) < max_new_tokens:
    block_idx += 1
    debug_stats['total_blocks'] = block_idx
    debug_stats['gamma_history'].append(current_gamma)

    # 1) Student generates 'current_gamma' draft tokens

### Model Configuration

- Teacher: Qwen3-32B
- Student: Qwen3-4B (this model is originally distilled from Qwen3-32B)
  - Same tokenizer / architecture family
- Used adaptive gamma for dynamic block size (heuristic)
  - n\_matches: number of tokens where teacher model accepted
  - If gamma increases, we think that the teacher trust the student more

```
prev_gamma = current_gamma
if n_matches == len(draft_ids):
    current_gamma = min(max_gamma, current_gamma + 2)
else:
    current_gamma = max(1, n_matches + 1)

if verbose and prev_gamma != current_gamma:
    print(f" 🔄 Adaptive Gamma: {prev_gamma} -> {current_gamma}")
```

### Hyperparameters

```
# Training
epochs: int = 5
batch_size: int = 1
learning_rate: float = 1e-5
gradient_accumulation_steps: int = 1 # User requested 1
max_grad_norm: float = 1.0
warmup_ratio: float = 0.1
lr_scheduler_type: str = "cosine" # Changed to cosine

# SKD Parameters
max_new_tokens: int = 4096
gamma: int = 20
top_k: int = 5
teacher_temperature: float = 0.7
teacher_top_p: float = 1.0
teacher_min_prob: float = 0.05
student_temperature: float = 0.7
student_top_p: float = 1.0
```

➔ **Input Query:** How did Choi Chung-heon take power during the Goryeo military regime and what were the political reforms he implemented?

Qwen3-4B (Baseline)	Qwen3-4B (LUPI-SKD)
<p>la información que has proporcionado sugiere que hay un error en la pregunta. Choi Chung-heon no fue un líder durante el régimen militar de Goryeo. El período de Goryeo (918-1392) fue una dinastía coreana que se dio en el sur de Corea, y no hay registros históricos de un líder llamado Choi Chung-heon en ese período.</p> <p>En realidad, en la historia coreana, hay un personaje llamado Choi Chung-heon, pero fue un líder durante la dinastía Joseon (1392-1897), no Goryeo.</p> <p>...</p> <p>Your question contains a historical inaccuracy. There is no historical figure named Choi Chung-heon who took power during the Goryeo military regime (a misnomer, as Goryeo was never a "military regime" in the modern sense).</p>	<p>the user is asking about Choi Chung-heon's rise to power and his political reforms during the Goryeo military regime. First, I need to confirm the background knowledge provided. The key points from the background are:</p> <p>Choi Chung-heon was a general who took power in 1056 by overthrowing King Taejong and King Taejo (Taejo). He established the military regime, which is considered a "military coup."</p> <p>His political reforms include:</p> <p>...</p> <p>Choi Chung-heon's rise to power and political reforms during the Goryeo military regime can be understood as follows:</p> <p>How He Took Power</p> <p>Choi Chung-heon, a military leader, seized control of the Goryeo royal court in 1056 by overthrowing King Taejong (the 26th king of Goryeo) and King Taejo (the 27th king).</p>

➔ Qwen3-4B model makes hallucination(even Spanish in reasoning path!) while our trained model generates correct answer

3. 알고리즘 소개
4. 실험 설계
5. 결과 분석
6. 토의 및 결론
  - 1) Limitations
  - 2) Conclusion/Future Work

### Language Limitations

- Due to the lack of Korean reasoning abilities on Qwen models, all experiments are conducted on the English(translated version) of the cultural dataset

### Out of Domain Benchmark Evaluations

- We did not evaluate the trained student model on cultural benchmarks (e.g., CLICK, BLEnD).

### General Reasoning Abilities

- We did not systematically measure whether injecting cultural knowledge via LUPI + SKD degrades general reasoning or standard NLP performance, leaving the trade-off between cultural specialization and overall capability unquantified.

### Conclusion

- With using small data (~200 samples, 180 are train and 20 are validation set), the model can generate reasoning paths about cultural reasoning.

### Future Works

Adaptive Top-K for given query

### Mixing with General Reasoning data (Ablation Study)

- While injecting cultural knowledge in small LRMs, degregation of general reasoning ability can easily observed.
- Mixing the data with general reasoning (Math, code, commonsense) is necessary.
  - 7:3, 5:5, 3:7, two step training with cultural reasoning and general reasoning ablation will be performed.
